

A Closer Look at Erectile Dysfunction

Commonly identified as ED, Erectile Dysfunction (or impotence) is the chronic inability to achieve and sustain an erection suitable for sexual intercourse. To achieve a full erection, there must be (1) a stimulus from the brain, (2) properly functioning nerves to the penis, (3) adequate blood circulation, and (4) the ability of the veins to conceal the blood inside of the penis. Any interference with these conditions can prevent a full erection.

Because men are reluctant to discuss ED with their doctors, the condition is underdiagnosed. Experts estimate that over 50% of men between the ages of 40-70 years old suffer from erectile dysfunction.

Considering Treatment

Failure to achieve an erection more than 50% of the time generally indicates a condition requiring some form of treatment. Seek help for ED right away, as it can lead to depression, anxiety, and low self-esteem.

ED not only affects males, it affects both partners in a relationship.

About Medispec

As the leading designer and manufacturer of effective shock wave and radial wave technology, Medispec has provided advanced, high-quality devices to the worldwide community for over a decade in the fields of Urology, Orthopedics, Cardiology, Aesthetics and Veterinary.

Using our application expertise, Medispec renowned reputation for reliability and unparalleled customer support is based on our unwavering dedication to excellence and superior clinical results. All of our products are designed with Modularity, Effectiveness, Versatility and Convenience and we are continuously researching new ways to improve patient's lives using shock wave therapy. Medispec's unique products give patients access to quality care.

ED1000™

Low-Intensity Acoustic Wave Therapy
for the treatment of Erectile Dysfunction

Patient Information Brochure

- ✓ Non-invasive
- ✓ Drug free
- ✓ Fast and pain-free treatment

OR-5-X502

New Hope for men suffering from Erectile Dysfunction

Reliable detection of vasculogenic Erectile Dysfunction (ED)

No more oral medications, vacuum pumps or injections

EDSWT targets the problem, not the symptoms

What are Shock Waves?

Shock Wave technology is used to generate extracorporeal (meaning outside of the body) acoustic waves to treat specific sites deep within the body tissue. These waves are generated by an underwater high-voltage spark, which induce neovascularization of the affected area -- relieving pain, improving blood flow, and ultimately resulting in tissue regeneration and repair.

Acoustic Wave Therapy for Erectile Dysfunction

With over 50% of men suffering from Erectile Dysfunction, the **Omnispec ED1000™** is the most effective solution on the market! This breakthrough, therapeutic treatment brings lasting improvement for erectile function and sexual health to millions of men -- without pain or medication.

Using the revolutionary non-invasive, acoustic wave technology known as EDSWT, the **ED1000™** focuses low-intensity waves on the blood vessels in the penis shaft to increase blood flow and encourage neovascularization. Unlike conventional treatments, such as PDE5 inhibitors, EDSWT does not involve the use of pharmaceuticals, making it a safe and natural procedure offering a real cure.

Unique Advantages

- Non-invasive procedure, requiring no anesthesia
- Eliminated pharma-related health risks
- Long Term improvement in erectile function
- No use of medications
- No reported side effects
- Pain-free procedure
- Use on demand

What to Expect

The EDSWT treatment requires a series of brief visits to your physician's office. Discernible improvement in the erectile function of the penis can be visible within a few weeks after therapy begins. Recent clinical studies revealed that patients reported a high rate of satisfaction for more than one year after treatment -- all without reliance on PDE5 inhibitors.

No more...

Oral Medications, Vacuum Pumps & Injections

ED1000™ Treatment Protocol

- 2 cycles of 2 treatments per week for 3 weeks
- 3-week rest period between cycles
- Each treatment is only 20 minutes

New Effectiveness for More Patients

Conventional treatments for ED include Medication, Hormone replacement therapy, Vacuum pumps, Injections, and Implants which only offer temporary solutions and can have extremely harmful side-effects. Using the revolutionary EDSWT acoustic technology, the **Omnispec ED1000™** device targets the problem and not just the symptoms, presenting a real cure with no reported side-effects or systemic load on other organs.

It is common for men to turn to medication, but it is important to know that medication only treats the symptoms, while the **ED1000™** solves the problem.

True Results. True Cure.
